

Discrete Mathematics (for Computer Science)

Part II: Computability

Zeyu Mi

TA: Yanfei Yang

2019-11-02

What problems can a computer solve?

Is a number
prime?

Easy!

A prime number is a natural number greater than 1 whose only factors are 1 and itself

Is a number
prime?

Easy!

A prime number is a natural number greater than 1 whose only factors are 1 and itself

Is a number
prime?

We only need to verify there are no
its factors from 2 to itself-1

```
bool isPrime(int n){  
    for(int i=2;i<n;i++){  
        if(n%i==0) return false;  
    }  
    return true;  
}
```

*Is a person good
programmer?*

What is a good programmer?

Well-known reality:

Produce 1000 lines of bug-free code per hour.

Sleep less than 5 hours.

Have less hair than 99% people.

Is a person good
programmer?

What is a good programmer?

Well-known reality:

Produce 1000 lines of bug-free code per hour.

Sleep less than 5 hours.

Have less hair than 99% people.

Is a person good
programmer?

We need to analyze his/her code data,
sleep data and hair data to say if
he/she is qualified.

```
bool isGoodProgrammer  
(codedata, sleepdata, hairdata){  
    .....  
}
```

Does god exist?

Emmmm

Does god exist?

What if god exists? And what if not?
What should we take into computation.

I can't tell. I don't think a computer
can solve this problem.

Easy!

Output
Constraints

Input

Is a number
prime?

A prime number is a natural number greater than 1 whose only factors are 1 and itself

We only need to verify there are no its factors from 2 to itself-1

Solution

Code

```
bool isPrime(int n){  
    for(int i=2;i<n;i++){  
        if(n%i==0) return false;  
    }  
    return true;  
}
```

What's a good programmer?

Output
Constraints

"Person" is too
abstract for
computation

Produce 1000 lines of bug-free code per hour.
Sleep less than 5 hours.
Have less hair than 99% person.

Is a person good
programmer?

Input

We need to analyze his/her code data,
sleep data and hair data to say if
he/she is qualified.

Solution

```
bool isGoodProgrammer  
(codedata, sleepdata, hair data){  
    .....  
}
```

Code

Computational Problem (计算问题)

- **Problems for computation usually have:**
 - Well-defined input
 - Constraints that the output must satisfy.
- **Some problems are hard because they are hard to converted into computational problems**
 - Existence of god
- **We only focus on the computational problems**

What about “computable”?

Input

Output

Input

Output

Computable (可计算的)

- A computational problem is computable if there is a procedure (or algorithm) for it which:
 - Rigorously follows some finite instructions, requires no ingenuity.
 - Always finishes (terminates) after a finite number of steps.

*Are all the computational problem
computable?*

Entscheidungsproblem (判定问题)

All axioms of math(Finite)

There is no natural number
whose successor is 0
...

First-order logic (谓词逻辑)

$\forall x \in N (0 \neq S(x))$
...

A statement of
first-order logic

Input

Prover

True. The statement can be
deduced from the axioms

False. Otherwise.

How do we investigate computability?

Problem has large varieties.

Graph Theory
A web server
A recommendation system
....

Unify

How to represent a problem?

Computer has many details.

Instruction set architecture
Memory management
Device management
...

Simplify

What is a set?

Emojis:

The hobbies of a talented man.

Or a bunch of things that even have no exact meaning

Definition

Set

A Set is an unordered collection of distinct objects, which may be anything (including other sets).

If a is an item of set A , we say that a belongs to A , writing as :

$$a \in A$$

If b is not an item of set A , we say that b doesn't belongs to A , writing as:

$$b \notin A$$

Representation

- **For simple sets, we can enumerate all the objects wrapped by curly braces**
 - {sing, jump, rap, basketball}
- **For some common sets, we use specific notations for them**

$\mathbb{N}$: All the natural number: $0, 1, 2, 3, \dots$

$\mathbb{Z}$: All the integer: $\dots, -2, -1, 0, 1, 2, \dots$

$\mathbb{Q}$: All the rational number

$\mathbb{R}$: All the real number

$\mathbb{C}$: All the complex number

$\emptyset$: Empty set, contains nothing. $\{\}$

U : The universal set, contains all the objects under *consideration*

Representation

For sets whose object has a certain property, we'll use set-builder notation

Set-Builder Notation

$$A = \{x|P(x)\} \text{ or } A = \{x: P(x)\}$$

Where P is a predicate, and A is the set of all elements which makes P true

$$\{x|x \text{ is a prime number}\} = \{2,3,5,7,11, \dots\}$$

Unorder (无序性)

The order of objects in a set doesn't matter

and

are identical

Distinction (相异性)

The objects in a set are distinguished, or the repeated elements are ignored.

and

are identical

Deterministic (确定性)

For any set A and any object a , whether a belongs to A is determinate and mutually exclusive.

either $a \in A$ or $a \notin A$

Relations Between Sets

Equal

A and B are equal iff they have the same elements

$$A = B \Leftrightarrow (\forall x)(x \in A \leftrightarrow x \in B)$$

Subset

A is subset of B iff every element of A is element of B

$$A \subseteq B \Leftrightarrow (\forall x)(x \in A \rightarrow x \in B)$$

Proper Subset

A is proper subset of B iff A is subset of B and A is not equal to B

$$A \subset B \Leftrightarrow (A \subseteq B \wedge A \neq B)$$

Relations Between Sets

$$1 \in \{1, 2, 3\}$$

$$\{1\} \subset \{1, 2, 3\}$$

$$\emptyset \subset \{1, 2, 3\}$$

$$\emptyset \in \{\emptyset\} \text{ and } \emptyset \subset \{\emptyset\}$$

For any set A , $\emptyset \subseteq A$

Venn Diagrams

Set Operation

Union(并)

$$A \cup B = \{x | x \in A \vee x \in B\}$$

Intersection

Intersection(交)

$$A \cap B = \{x | x \in A \wedge x \in B\}$$

Difference

Difference(差)

$$A - B = \{x | x \in A \wedge x \notin B\}$$

Complement

$$\text{Complement}(\neg) \\ -A \text{ or } \bar{A} = \{x | x \in U \wedge x \notin A\}$$

Symmetric Difference

Symmetric Difference(对称差)

$$A \oplus B = \{x | x \in A \bar{\vee} x \in B\} = (A - B) \cup (B - A)$$

Generalized Union/Intersection

Generalized Union/Intersection(广义并/交)

$$\bigcup A = \{x | (\exists z)(z \in A \wedge x \in z)\}$$

$$\bigcap A = \{x | (\forall z)(z \in A \rightarrow x \in z)\}$$

$$A = \{\{a, b, c\}, \{a, b\}, \{b, c, d\}\}$$

$$\text{Then } \bigcup A = \{a, b, c, d\}, \bigcap A = \{b\}$$

Define that $\bigcup \emptyset = \emptyset$, $\bigcap \emptyset$ is undefined!

Set Identities (集合恒等式)

Identity laws (同一律)

$$A \cap U = A$$

$$A \cup \emptyset = A$$

Commutative laws (交换律)

$$A \cup B = B \cup A$$

$$A \cap B = B \cap A$$

Domination laws (零律)

$$A \cup U = U$$

$$A \cap \emptyset = \emptyset$$

Associative laws (结合律)

$$A \cup (B \cup C) = (A \cup B) \cup C$$

$$A \cap (B \cap C) = (A \cap B) \cap C$$

Idempotent laws (幂等律)

$$A \cup A = A$$

$$A \cap A = A$$

Distributive laws (分配律)

$$A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$$

$$A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$$

Set Identities

Complementation law (双补律)

$$\overline{(\overline{A})} = A$$

Complement laws (补余律)

$$A \cup \overline{A} = U$$

$$A \cap \overline{A} = \emptyset$$

Absorption laws (吸收律)

$$A \cup (A \cap B) = A$$

$$A \cap (A \cup B) = A$$

De Morgan's laws (摩根律)

$$\overline{A \cap B} = \overline{A} \cup \overline{B}$$

$$\overline{A \cup B} = \overline{A} \cap \overline{B}$$

$$A - (B \cap C) = (A - B) \cup (A - C)$$

$$A - (B \cup C) = (A - B) \cap (A - C)$$

Proof of Set Identities

Method 1: Using definition

Example: $A \cup B = B \Rightarrow A \subseteq B$

Analysis: We need to prove $A \subseteq B \Leftrightarrow \forall x(x \in A \rightarrow x \in B)$, so the proof structure is

for any x , assume $x \in A$, {...bunch of inference...}, we get $x \in B$

Proof:

For any x , assume $x \in A$, according to the definition of set union, $x \in A \cup B$. And $A \cup B = B$, so we get $x \in B$. Q.E.D.

Proof of Set Identities

Method 2: Using logical equivalent operation

Example: $A - (B \cup C) = (A - B) \cap (A - C)$

Proof:

$$\begin{aligned}x \in A - (B \cup C) &\Leftrightarrow (x \in A) \wedge (x \notin (B \cup C)) \\&\Leftrightarrow x \in A \wedge x \notin B \wedge x \notin C \\&\Leftrightarrow (x \in A \wedge x \notin B) \wedge (x \in A \wedge x \notin C) \\&\Leftrightarrow (x \in (A - B)) \wedge (x \in (A - C)) \\&\Leftrightarrow x \in ((A - B) \cap (A - C))\end{aligned}$$

Proof of Set Identities

Method 3: Deriving a set algebra using known identities or equations

Example: $\overline{A \cup (B \cap C)} = (\overline{C} \cup \overline{B}) \cap \overline{A}$

Proof:

$$\begin{aligned}\overline{A \cup (B \cap C)} &= \overline{A} \cap \overline{(B \cap C)} && \text{by the second De Morgan law} \\ &= \overline{A} \cap (\overline{B} \cup \overline{C}) && \text{by the first De Morgan law} \\ &= (\overline{B} \cup \overline{C}) \cap \overline{A} && \text{by the commutative law for intersections} \\ &= (\overline{C} \cup \overline{B}) \cap \overline{A} && \text{by the commutative law for intersections}\end{aligned}$$

Proof of Set Identities

We can use venn diagram to help analyzing.

$$\overline{A \cap B}$$

$$\overline{A} \cup \overline{B}$$

This is not a proof!!

Wait a minute,
What is the relationship between set theory and
computational problems?

Types of Computational Problem

Imaging that there is a god who knows all the Boolean formulas which are satisfiable, and he puts them all into a set

Set of all the Boolean formulas which are satisfiable, mark as S

$$a \wedge b$$

 a b

$$(a \vee b) \wedge (a \vee c)$$

$$(a \vee \neg b) \wedge (b \vee \neg c) \wedge (c \vee \neg a)$$

 $\dots$

$$a \wedge \neg a$$

Solve Decision Problem

A Boolean formula t is
satisfiable?

Is t in S ?

$a \wedge b$

a $(a \vee b) \wedge (a \vee c)$
 b
 $(a \vee \neg b) \wedge (b \vee \neg c) \wedge (c \vee \neg a)$

...

S

$a \wedge \neg a$

Solve Decision Problem

For any decision problem, we can define a predicate P :

$P(x)$: (x is a valid input) $\wedge$ (x satisfies the property the problem asks)

Then we can build the set:

$$S = \{x | P(x)\}$$

Then the decision problem can be converted to:

Take x as input and decide whether $x \in S$, that S is a known set.

This is called membership problem.

Solve Decision Problem

Solve Decision Problem

 $\dots$

subset of Σ^*

A language

Languages are sets of strings.

$\vee \wedge abc$
 $a \wedge \neg a$
 $(a \vee b) \wedge (\neg b \vee c)$
 $\dots$

Set of all string : Σ^*

Language Recognizing

Throughout the whole course of computability, we'll focus on the membership problem of a language, or language recognizing, that is:

Given a language L and take w as input, determine whether $w \in L$.

~~What problems can a computer solve?~~

What languages can a computer
recognize?
